ABSTRACT

MARC II database statistics and trends from the years 1973-74 to 1980-81 are presented for the benefit of processors of the MARC file who may use the data for planning file structures, selecting subsets of MARC for local processing, estimating processing time based on record sizes, and estimating future file sizes based on growth rates. It is noted that the statistics can also be valuable in the preparation of user profiles and search strategies for subject searching of the MARC database online, and in the establishment of content definitions for full and abridged bibliographic records. Tables included in the report provide a detailed characterization of the content and changes in the MARC database in terms of such basic attributes as record length, field tag occurrence, data element length per field tag, and distribution of records by Dewey Decimal Division and Library of Congress class code. Distributions for Library of Congress categories vs. mean record length, and main entry length vs. mean record length, are also given. A brief analysis of trends precedes the report's extensive tables. (Author/ESR)

ABSTRACT

MARC database statistics are presented for the benefit of processors of the MARC file who may use those data for purposes of planning file structures, for selecting subsets of MARC for local processing, for estimating processing time based on record sizes, and for estimating future file sizes based on growth rates. Statistics pertaining to record lengths, field tag occurrence, data element length per field tag, and distribution of records by Dewey Decimal Division and Library of Congress class code are given. Library of Congress categories vs. record length and main entry length vs. record length distributions are also provided. The statistics can also be valuable in the preparation of user profiles and search strategies for subject searching of the MARC database online.

The University of Illinois, the Council on Library Resources and the authors gratefully acknowledge the generous contribution of the Library of Congress in providing the MARC - BOOKS ALL tapes from which all data in this report were derived. We wish to acknowledge the assistance of Henriette Avram through whose good offices arrangements for obtaining the Library of Congress material were made.

1. INTRODUCTION

In June 1976 Williams and Shefner published a paper entitled, "Data Element Statistics for the MARC II Database" in JOLA (Vol. 9/2).[1] Responses to this and a subsequent paper (JOLA Vol. 12/4)[2] indicated an interest in and request for the same type of statistics on a wider scale plus additional breakdowns and multi-year comparisons. In this paper we have provided statistics for eight years of the MARC database.

The years covered are 1973-74, 1974-75, 1975-76, 1976-77, 1977-78, 1978-79, 1979-80 and 1980-81. These years correspond to Volumes 1 through 8 of the second series of MARC (MARC2). The first series of MARC tapes began with Volume 1 in 1969, and continued through Volume 4 which covered the year 1972-73. There was also a previous volume, Volume Ø, which included pre-1968 records and is referred to as RECON. We did not cover Volume Ø or the first MARC series.

The second series, MARC BOOKS ALL began again with Volume 1 and covered the year 1973-74. We have processed tapes for Volumes 1 through 8 of the MARC BOOKS ALL series. All tables are appropriately labeled to indicate coverage.

In all cases the term "record" refers to one bibliographic record which constitutes one logical record. Documentation consulted for the MARC records, tag numbers, field definition etc., was provided by OCLC[3] and the Library of Congress[4]. Records excluded from our processing were records with the following encoding level codes (in byte position 17 of the leader where the first position is position Ø).

E-OCLC system identified an error

J-MARC deleted records

K-OCLC member input sublevel record

O-Order records

We included new, corrected (corrected records include all fields--not just corrected data), and previously CIP records as designated in byte position 5 of the leader.

Number of Records in Table 1 may vary slightly from numbers counted by other investigators. The reason is that bad records (parity errors, etc.) were not counted or processed. The number of bad physical records per volume ranged from less than .01% to slightly more than .02%.

2. FIELD TAG OCCURRENCE STATISTICS

Field tag occurrence statistics generated on a volume basis for the years 1973-74, 1974-75, 1975-76, 1976-77, 1977-78, 1978-79, 1979-80 and 1980-81 are presented in Table 2. The column marked "Field Tag" indicates the MARC tag numbers. The "Total Records" column indicates the total number of records that contain the particular element at least once. "Percent of Records" indicates the percent occurrence for those records in which the element occurs. The "Total Occurrence" column indicates, for each tag number, the total number of times that data element (including multiple occurrences per record) occurs in the database. "Occurrence per Record" indicates the average number of times the field tag occurred per record for those that contain the element.

Comparisons of field tag occurrences were made using Volume 1 data as the base. Thus data for Volumes 2 through 8 are compared with Volume 1 in Table 3.

3. FIELD TAG PERCENT OCCURRENCE AND CHANGE IN OCCURRENCE

Change in Percent Occurrence of Tags (>5% change)

ISBN's (field tag 20) have increased 19.57% from Volume 1 to Volume 8. The largest increase occurred between Volume 1 and Volume 3; it has held fairly steady since Volume 3 when the percent occurrence was 64.35. The peak was

in Volume 4 with 67.15 and in Volume 8 the occurrence was 66.74. The growth reflects the fact that publishers have come to recognize the value of unique identifiers--not only for use by others but also in their internal inventory control systems. Inasmuch as the percent occurrence seems to be stabilized at about 66%, one wonders what accounts for the 34% that don't employ ISBNs.

Dewey Decimal Class Numbers (field tag 82) has decreased significantly since Volume 1 when it occurred in 92% of the records. This increased to 96.66% in Volume 2 and then decreased in Volumes 3 and 4. A big decrease occurred between Volumes 4 and 5 going from 83% to 69% and has stayed around 68% for four years. This undoubtedly reflects budget limitations for LC's providing cataloging of fields that are not essential for its own purposes. DDCs are provided as an accommodation to libraries that do not use LC classification numbers.

Price of Title (field tag 350) has dropped from 47.73% occurrence to 3.84% for a drop of 43.89% from Volumes 1 to 8. This decrease appears to reflect the fact that price information is of limited value--book prices are not stable.

Added Entries--Personal (field tag 700) have increased in percent occurrence by 9.10%. This could be because fewer personal name main entries were assigned (down 3.78) and consequently more personal name added entries were assigned. This, however, does not account for the entire increase. There may have been more multi-authored and multi-edited works.

National Bibliography Numbers (field tag 15) has an increased occurrence of 9.92% to an occurrence of 41.81%.

General Notes (field tag 500) have increased from an occurrence of 39.25% in Volume 1 to 53.98% in Volume 8. This increase of 15% may be indicative of one or more of the following conditions: (a) incompleteness of the MARC format in providing tags for cataloging data that are newly appearing in books; (b) inability of catalogers to determine the appropriate note field or other tag which might be the proper designation for these data: and (c) catalogers attempting to provide more complete cataloging--covering features that they had not previously discussed.

Bibliographic Notes (field tag 504) have increased in occurrence by 5.15% from Volume 1 to Volume 8. This could mean that there are more bibliographies published in monographs or that catalogers are being more attentive to the inclusion of this element.

Subject Headings--Topical (field tag 650) have increased in percent occurrence by 7.97% and this indicates that more topical subject cataloging is being done. The other kinds of subject cataloging--personal, corporate name, conference/meeting, uniform title, and geographic name--have all increased but only slightly.

Missing or Very Slightly Represented Fields

Field tag 35 (local system control no.) occurred only in Volumes 6, 7 and 8. This field is primarily used by systems other than LC. Those that appear in MARC records are contributed rather than originally catalogued by LC.

Field tag 39 (level of cataloging identifier) occurred for the first time in Volume 8 (3.75%).

Field tag 81 (unassigned) occurred only in Volume 6 and is presumably a data entry error.

Field tag 241 (Romanized title) occurred in all volumes but never more than .01%.

Field tag 263 (projected publication date) occurred in Volume 1 and not again until Volume 6 and has grown steadily increasing 3-4%/year.

Field tag 652 (reversed geographic) occurred for the first time in Volume 7 (0.03%) and more than tripled in percent occurrences to 0.10 in Volume 8.

Field tag 830 (series added entry--uniform title heading) occurred for the first time in Volume 4 and has been represented in succeeding volumes but never occurs in more than 0.30% of the records.

Field tag 850 (holdings) occurred for the first time in Volume 7 and again in Volume 8 but it occurred in fewer than 0.005% of the records.

Field Tags Occurring in 100% of Records

Field tags 1 (control no.); 8 (fixed length data); 245 (title); 260 (imprint) occur 100% of the time in Volumes 1,2,7, and 8 and 99.99% in Volumes 3, 4, 5, and 6; 300 (collation) appeared in all records in Volumes 7 and 8 and it occurred in more than 99.8% of the records for all other volumes.

The average number of fields per record--including multiple occurrences per record--increased slightly over the eight volumes analyzed as can be seen in Table 4. The growth in average number of tags per volume is accounted for by the addition of new tags in Volumes 4, 6, 7, and 8. Specifics regarding which tags were added or deleted and when this occurred are provided in Table 6.

The average number of unique fields per record--ignoring multiple occurrences--ranges from 10.60 in Volume 5 to 12.94 in Volume 8 as can be seen in Table 5. The average number of unique tags increased suddenly in Volume 6 when three new fields were added.

Record lengths have varied slightly over the eight volumes of MARC BOOKS ALL as is shown in Table 7. The mean increased for three volumes, decreased in Volume 5 and then increased in each of the subsequent volumes. From Volume 1 through 8 the length grew from 654.68 to 711.35 for an increase of 8.7%. This may not appear to be a large increase but when considering the average increase in average size/record together with the increase in the number of records, it amounts to an increase of 300% in the number of characters in the database and consequently increases storage requirements proportionately. While minimum record lengths have remained relatively constant, the maximum lengths have increased substantially since Volume 6. The shortest maximum length among the eight volumes is 2030 in Volume 3 and the longest maximum length record among the eight volumes occurred in Volume 7. It has 3684 characters for an increase of 81% over the Volume 3 long record. While the very long records may occur only infrequently, their presence could present a problem to any processor of MARC files whose software cannot accommodate records beyond x characters where x = the new maximum.

Field Lengths

Field lengths (mean, maximum, minimum and standard deviation) are provided for Volumes 1 through 8 in Table 8. Column 1 specifies the MARC field tag number, column 2 indicates the total number of occurrences of that field tag for the volume. The adjacent columns specify the mean length, the maximum length, the minimum length and the standard deviation for the data in the field. In general, mean field lengths are stable except for very low occurrence fields and for field 500 (general notes) which has decreased steadily, field 505 (contents note) which has decreased from 272 to 190 and field 810 (series added entry--corporate name) which has increased from 83 to 96.

Table 9 provides mean lengths for MARC fields for Volumes 1 through 8. These are presented to permit easy visual comparisons. If these data are used for estimating file sizes, etc. they must be considered in relation to the field tag occurrence data (Tables 2 and 8). A significant increase in the length of a field that occurs seldomly may have less impact than a smaller increase in a field that occurs in a high percentage of all records. Table 10 indicates the changes in number of field tags that have occurred from volume to volume. It indicates the number of field tags per year, the number that have increased in length, stayed the same, or decreased relative to the prior year.

4. DISTRIBUTION OF RECORDS BY DEWEY DECIMAL DIVISION

Distribution data for MARC records by Dewey Decimal Divisions are presented in Table 11. The division numbers in the "Division" column represent the digits preceding the decimal point in the Dewey numbers. They are grouped in increments of 10 ranging from zero to 990. All non-numeric Deweys are listed as "others." The "count" column indicates the total occurrences in all records for each range of 10. The "percentage" column indicates the percent of occurrence in records that contain Dewey numbers. As can be seen in Table 3 (tag 82) Deweys have decreased from the 90% range for the first three volumes to 83% in Volume 4 and then decreased to the 68-69% range for Volumes 5-8.

The Dewey Division groups that ranked in the top ten for at least one of the 8 volumes are listed in Table 12. The position of a group is indicated by a number from 1 to 10 (1st to 10th). Six of the Dewey groups ranked in the top 10 in all eight volumes, one in seven volumes, one in six volumes, two in five volumes, one in three volumes and three in two volumes.

Fourteen of the Dewey groups ranked in the top 10 at least twice. Dewey division 330 (Economics) ranked first in all 8 volumes. DD 340 (Law) ranked second in 5 of the 8 volumes. DD 910 (Geography) was in 2nd and 4th position in Volumes 1 and 2 respectively and then dropped out of the top 10 entirely. DD 940 (General History of Modern Europe) did not appear in the top 10 until Volume 7 when it assumed position 5. DD 610 (Medicine) started out in 8th position in Volume 1 and rose to 3rd position in Volume 4.

5. LC CLASS NUMBER OCCURRENCES AND LENGTHS

Table 13, LC Class Occurrences, and Table 14, Top LC Class Groups, provide LC Occurrence statistics for eight years of MARC BOOKS ALL. The analysis is based on the two-alpha character portions of LC class numbers which are then collapsed to the one-alpha character portion of the LC class number. Data in Table 13 represent the percent occurrence of records per volume for each of the 22 letter designations for LC classes. No single character category accounts for more than 10% of the records except for H (Social Sciences) and P (Language and Literature). Of the 22 categories over eight years from three to six categories were present in less than 1% of the records. The presence of 0.00 in a cell indicates that that category was found on the database for that volume but it occurred in fewer than .005% of the records; we retained only two places after the decimal point hence those small numbers do not appear on the table. A blank cell indicates that the category did not appear in any records for the particular volume of the database. Classes I (unassigned by LC) and O (unassigned by LC) are always either not present or present on a very small number of records; when present we assume they are a result of data entry errors. Classes A (generalities), U (military science) and V (naval science) occur in all eight volumes but always in fewer than 1.0% of the records.

Table 14 indicates the 12 populous LC classes that account for the top ten classes for all eight volumes of MARC BOOKS ALL. The eight of the 12 top ten classes that occur in all eight volumes are B (philosophy and religion), D (history; general and old world), H (social sciences), L (education), P (language and literature), Q (science), R (medicine), and T (technology). Two classes occurred in five of the eight years, E-F (history ; America) and N (fine arts). Class K (law) occurred in four of the volumes and class G (geography) occurred in two. Class P (language and literature) always ranked first, class H always ranked second. B, D and Q vie for third. Q was third for Volumes 1 through 4, B was third in Volume 5 and D assumed third position in Volumes 6, 7, and 8.

Table 15 shows LC class occurrences for non-juvenile and juvenile material separately as well as combined. Table 16 provides more detail than the single alpha character data in Tables 13, 14 and 15. Table 16 provides the two alpha character positions of LC class numbers. Single character divisions, such as Q for all of science, do not provide the level of information that many might want. Because many libraries do not maintain juvenile collections, or because they treat them differently, we have provided separate and combined data for juvenile and non-juvenile records.

In Table 17 the mean record lengths for all volumes are given in the last row. Mean record length varies with LC class. The class with the shortest records is P with records ranging from 562.93 to 597.59 characters per record. Since P is the most populous class, it tends to reduce the mean record length over all classes.

Table 18 provides further detail regarding record lengths as they are distributed across single character LC classes. In addition to the means

provided in Table 17, Table 18 provides for each volume the number of occurrences of the LC class, minimum length, maximum length and standard deviation. Table 19 provides record length statistics for two-character LC classes. Included are mean length, standard deviation, maximum length and minimum length.

Table 20 provides record length distribution data for single-character LC classes broken down into non-juvenile, juvenile and combined groups. The row designated "total" provides the mean length for the total number of records for all LC classes for each of the three groups. In general juvenile records are longer than non-juvenile records in all LC categories except for a few cases, such as A, Q, S, and W in specific volumes. Although the mean length for all juvenile records was longer than the mean length for non-juvenile records in all volumes except 2 and 3, in no case was the mean length for non-juvenile and juvenile records combined increased by more than one over non-juvenile alone.

6. MAIN ENTRY LENGTH VS. RECORD LENGTH

Main entry statistics for Volumes 1 through 8 are given in Table 21. Main entries are split into the four categories: personal name, corporate name, uniform title, and conference or meeting. Table 21 provides the number of occurrences, percent occurrences, mean length, standard deviation, maximum and minimum lengths within each of these categories as well as a combined total. As one might expect, personal name main entries are the shortest with a mean length of 26 or 27 in all eight volumes. The next shortest main entry is conference or meeting with mean lengths from 38 to 45. Third is corporate name ranging from 56 to 59. Finally, uniform title is the longest with mean lengths

ranging from 80 to 84. The mean length for all main entries ranged from 31 to 33. Personal name with more than 80% occurrence of all records in all years brings the average down even though the other three types exceed the mean length by at least five.

Table 22 provides main entry vs. record length distribution for Volumes 1 through 8. Main entry lengths are grouped in increments of 5. Although these data were generated for each main entry category separately, only the combined data for all main entry types are presented in Table 22.

In addition to tables providing single character LC class record length distributions, we also generated two-character LC class record length distribution tables and these are divided into non-juvenile, juvenile and combined groups. The 51 pages of two-character tables are not included in this report. Similarly, 32 pages of tables providing detailed main entry record length data for the four types of main entry (personal, corporate, uniform title, and conference) are not included in this report. If some reader would like these two sets of tables we would be happy to give them to the first requester.

7. CONCLUSION

This report provides detailed data and analyses of characteristics for volumes 1 through 8 of the LC MARC Database BOOKS ALL. Three aspects are considered: (1) statistics--such characteristics of the database as record length, field tag occurrences, and field lengths; (2) trends--found through a comparison of statistics across volumes of the MARC tapes; and (3) relationships--found through analysis of database attributes such as LC class vs. record mean lengths.

The study is directly related to a fundamental activity of the Bibliographic Service Development Program, the determination of the character of the bibliographic databases to be made available and the establishment of content definitions for full and abridged bibliographic records. The tables included in this report provide a detailed characterization of the content and changes in the MARC database in terms of such basic attributes as field tag occurrences, field lengths, and record lengths. These data document current practice with regard to content for full bibliographic records, providing a starting point for consideration of an appropriate content definition for full records. The data also have some bearing on efforts to establish a content definition for abridged bibliographic records, as such a definition must take into account the frequency with which certain fields are currently used, as well as the record length which would result if certain subsets of the fields were selected as the basis for abridged bibliographic records. The data and analyses presented in this report should be of interest to all those involved in creation and maintenance of bibliographic databases, as well as in provision of access to bibliographic databases.

LC Class vs. Record Mean Lengths

Table 17

Note: There are slight discrepancies between mean lengths given in Tables 7 and 17; this is because LC class occurs in slightly fewer than 100% of the records.

	NUMBER OF OCC.	MEAN LENGTH	S. D. OF LENGTH	MAX LENGTH	MIN LENGTH
